CO₂ PERFORMANCE LADDER

CO₂ policy

Nijburg Products BV has been pursuing a CO₂ policy since 2019 with the aim of reducing CO₂ emissions. The policy is based on the principles of the CO₂ Performance Ladder. Today, our organization is on step 3 of the CO₂ Performance Ladder.

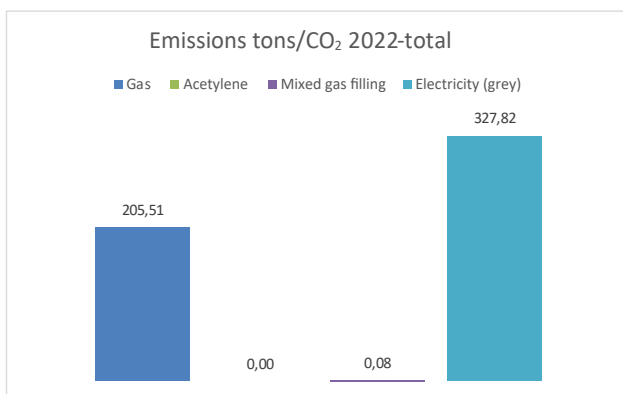

Reduction measures

In order to achieve the above-mentioned objectives, the following CO₂ reducing measures are taken:

- Adjustment of energy contract to green gas CO₂-compensated gas and green electricity in 2024, in accordance with requirement 2.B.2 of the CO₂ Performance Ladder.
- Place compartments, except hall 3 due to existing machines.
- Replacement roof hall 4. Halls 1, 2 and 3 have now been realised.
- Reuse residual heat from various machines via heat exchanger.
- Using geothermal heat for heating production halls.
- Replacement fluorescent with LED fixtures at a natural time. Hall 1, 2, 8, 9 and prefab now realized.
- Install solar panels.
- Purchase of energy-efficient production machines.
- Purchase of an electric fleet.
- Monitor energy consumption per machine.

CO₂ footprint 2022

The total CO₂ emissions for the year 2022 amount to 533.41 tonnes. Most of this is caused by electricity consumption.

Reduction targets

The management of Nijburg Products BV would like to achieve the following reductions compared to reference year 2019:

	2019	2020	2021	2022
Scope 1	1 %	2 %	15 %	60 %
Scope 2	1 %	2 %	20 %	75 %

With this set of reduction targets and measures, we expect to be able to make our contribution to a sustainable planet.

On the Nijburg Industry Group website you can find more details about the above topics and other CO₂ Performance Ladder related matters under the heading [“About us”](#).
